

```
NODE.INTRO( (err, ideas) => {  
  if (err) throw new Question(err)  
  else understand(ideas)  
})
```

TIMELINE

**What is
node?**

**That doesn't
help**

**What does
it do?**

**A JavaScript runtime
environment**

...a tool

**It executes JavaScript on an
operating system, instead of in a
web browser**

files (e.g. app.js)

fs

process

net

`<script></script>`S

window

history

document

WHY CARE?

If you want to create a server and know JavaScript

WHY CREATE A SERVER?

If you want to create a custom website or webapp

SERVER

- ◉ **A program running on a computer connected to the internet**
- ◉ **Serves content requested by remote clients**

IF PROGRAMMING WERE
COOKING...

Program vs. Process

"recipe"

- ◉ Program is data
 - machine code (pre-compiled)
 - bytecode (re-compiled by a VM)
 - text file (can be interpreted)
- ◉ Inert — not doing anything
- ◉ Ready to be run as a process

"cooking"

- ◉ Process is execution
 - memory allocated
 - CPU performing steps
- ◉ "Live"
- ◉ Produces results
- ◉ Interactive
- ◉ Can be started/stopped
- ◉ Multiple processes from one program...

MODULES AND THE NODE ENVIRONMENT

GLOBAL VARIABLES

Every module in Node has access to the same set of global variables

`process`

`global`

`console`

`setTimeout/clearTimeout`

`setInterval/clearInterval`

"GLOBAL" (MODULE) VARIABLES

- ◉ **Every module in Node has its own set of “module” variables that are available in the default scope**

```
__dirname  
__filename  
module  
require
```

module

- ◉ **Object**
- ◉ **Represents the module itself**
- ◉ **Most importantly, has a property called** `exports`

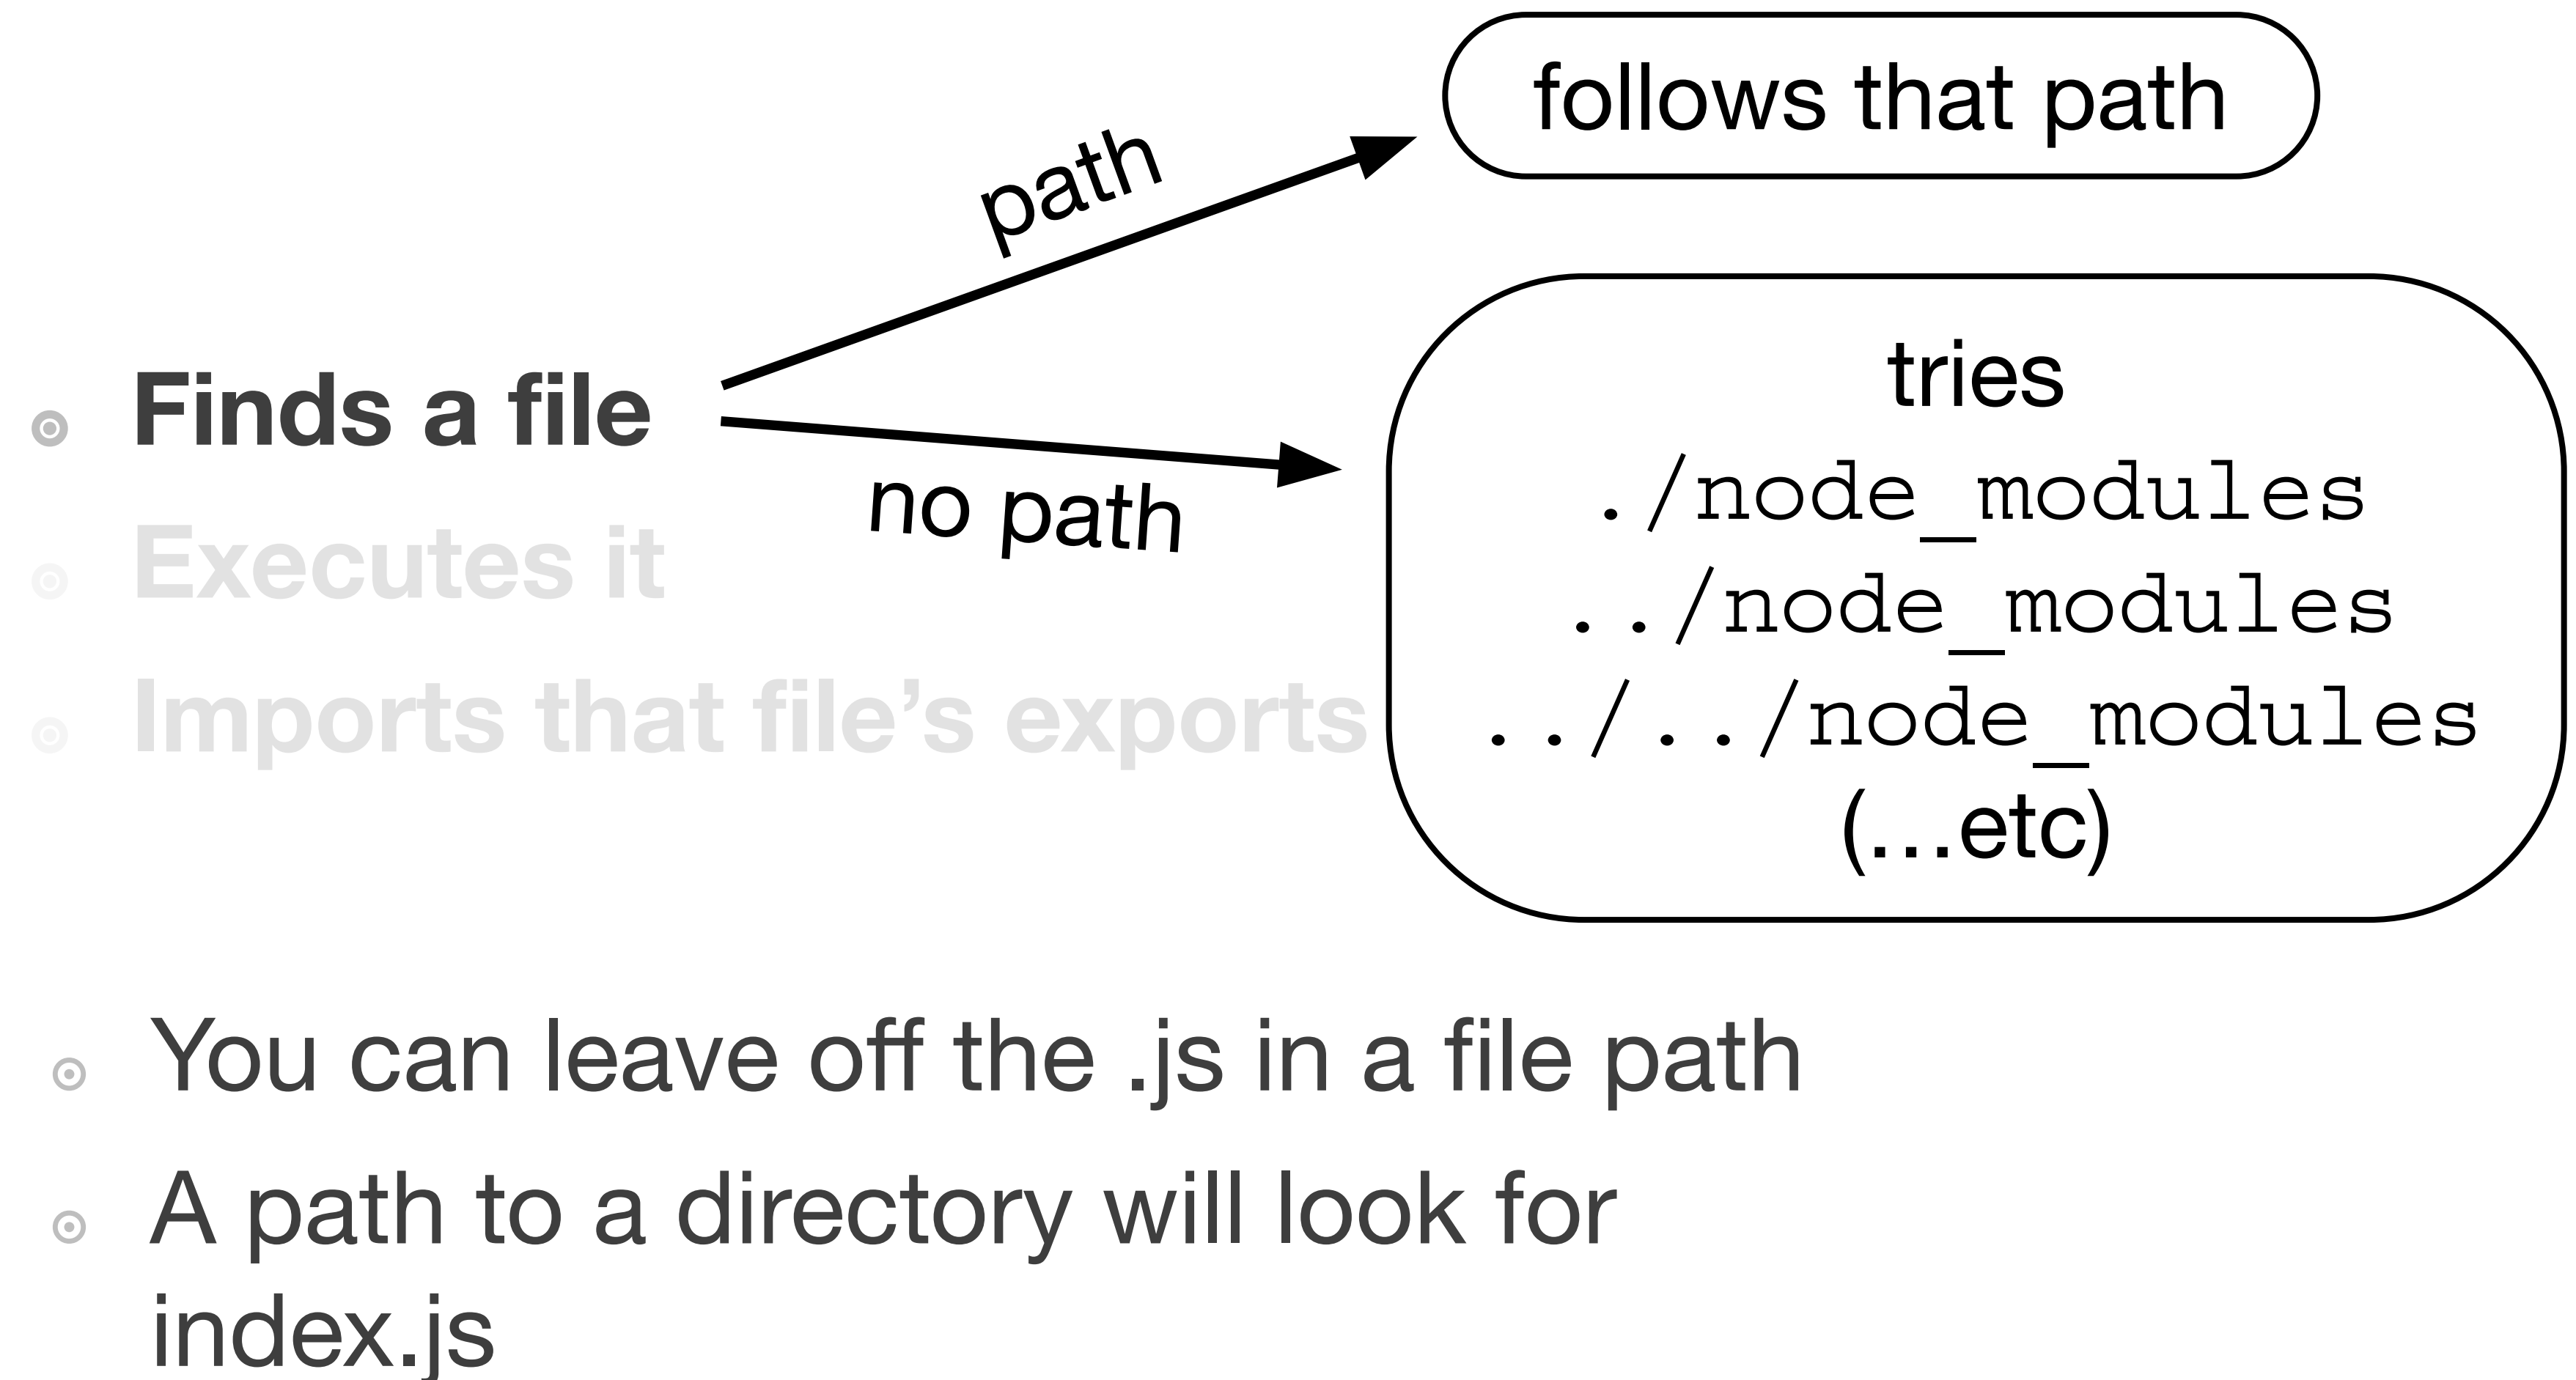

`module.exports`

- **Initially an empty object**
- **Assign it the data you want to expose**
- **A `require` of this file (“module”) will return its `module.exports`**

require

NPM

- ◉ **n**ode **p**ackage **m**anager
- ◉ **Command line tool**
- ◉ **Can find libraries of code online**
- ◉ **Downloads them locally or globally (into `node_modules` directory)**
- ◉ **Keeps list of project dependencies in `package.json`**

`package.json`

Describes your project, e.g. its dependencies...

- ◉ **Collaboration within your team**
- ◉ **Sharing within the node community**

SUMMARY

- ◉ **Node allows for server-side JavaScript**
- ◉ `require` **pulls in what** `module.exports` **exposes**
